KEYSIGHT TECHNOLOGIES
Unlocking Measurement Insights

Keysight's NEW Truevolt Digital Multimeters (DMMs) offer a full range of measurement capabilities and price points with higher levels of accuracy, speed, and resolution.

Get more insight quickly

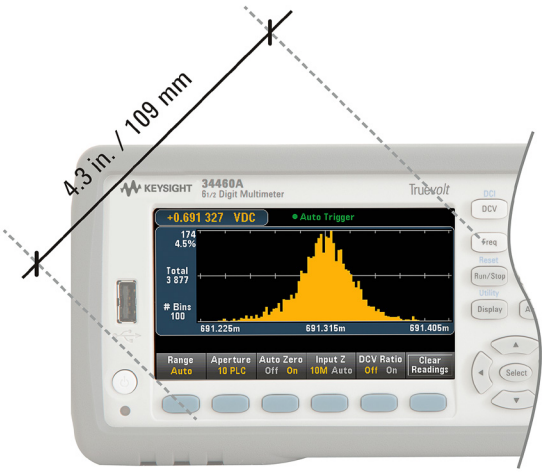
Truevolt DMM's graphical capabilities such as trend and histogram charts offer more insights quickly. Both models also provide a data logging mode for easier trend analysis and a digitizing mode for capturing transients.

Measure low-power devices

The ability to measure very low current, 1 µA range with pA resolution, allows you to make measurements on very low power devices.

Maintain calibrated measurements

Auto calibration allows you to compensate for temperature drift so you can maintain measurement accuracy throughout your workday.



The bright, 4.3" high-resolution monitor is a prominent feature of Keysight's Truevolt DMM family.

Bar meter mode provides the number display along with an analog meter to provide a visual view of your measurements.

Histogram mode gives you a statistical view of your measurements.

Number mode provides the traditional “digits” view of measurements.

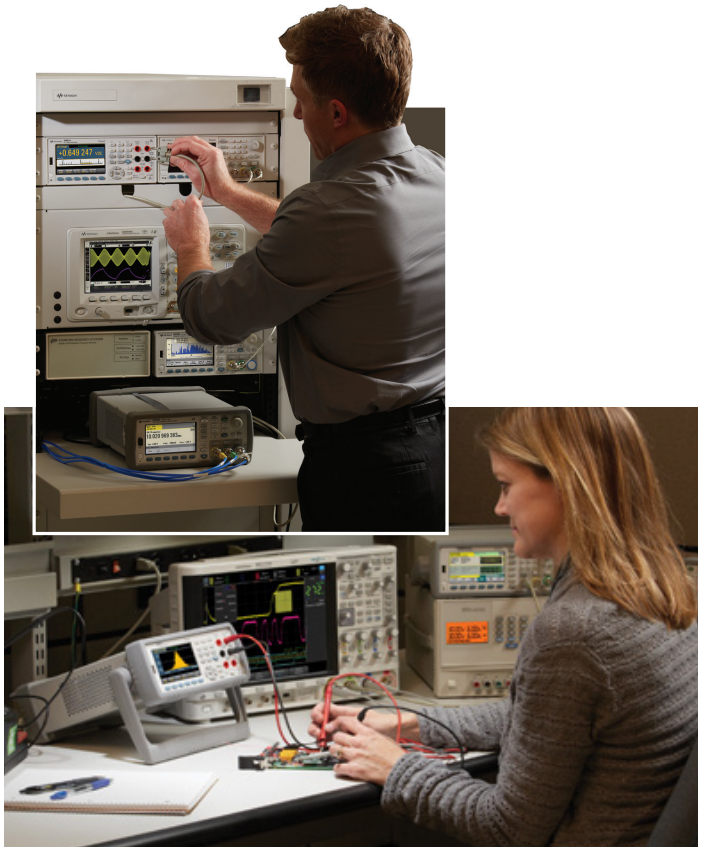
Measure with Unquestioned Truevolt Confidence

Worry about the quality of your design, not the quality of your measurements

In a rack or on a bench real-world signals are never flat. They have some level of AC signal riding on top from power line noise, other environmental noise, or injected current from the meter itself. How well your meter deals with these extraneous factors and eliminates them from the true measurement makes a big difference to your accuracy. Behind the scenes, Keysight’s Truevolt technology accounts for measurement errors created by these real-world factors so you can be confident in your measurements and it is only available on Keysight DMMs.

Truevolt technology starts with an analog-to-digital converter that enables a patented metrology-grade architecture. Using this architecture, Keysight delivers a good balance of measurement resolution, linearity, accuracy, and speed at a value price, all derived and guaranteed per ISO/IEC 17025 industry standards.



BenchVue Software

Data capture simplied. Click. Capture. Done.

BenchVue software for the PC makes it simple to connect, control, capture and view Keysight's DMMs simultaneously with other Keysight bench instruments with no additional programming.

- Visualize multiple measurements simultaneously
- Easily log data, screen shots and system state
- Rapidly prototype custom test sequences
- Recall past state of your bench to replicate results
- Export measurement data in desired format fast
- Quickly access manuals, drivers, FAQs and videos
- Monitor and control bench from mobile devices

The Digital Multimeter App within BenchVue enables control of digital multimeters to visualize measurements, perform data logging [1] and annotate captured data (included in model BV0000A). Upgrading to the Pro version (model #BV0001A) provides histograms, digitizer capability and unrestricted data logging with limit checking and alerts.

Benefit from a new perspective by visualizing multiple DMM's at the same time

- Display single measurements, charts, tables, or histograms from a single instrument or multiple DMMs simultaneously to correlate trends you might otherwise miss.

Record measurements and export results in a few clicks

- Log and export data quickly to popular tools such as Microsoft Excel, Microsoft Word and MATLAB for documentation or further analysis.

Access and control tests on your DMM remotely

- With the companion BenchVue Mobile app, monitor and respond to long-running tests from anywhere.

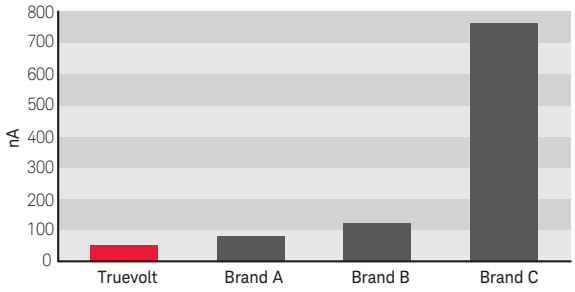
Measure with Unquestioned Truevolt Confidence

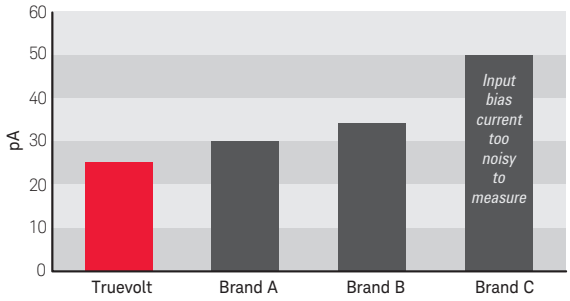
What Truevolt technology means to you:

You can measure your real-world signals, not instrument error

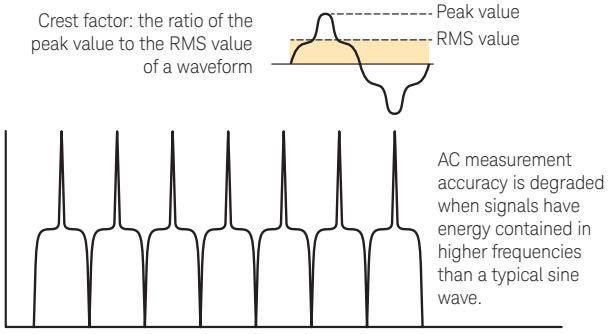
Noise and injected current: Keysight Truevolt DMMs contribute less than 30% of the injected current than alternatives. Compared to some lower cost alternatives, Truevolt DMMs offer almost 100% less noise.



Input bias current: Ideally, no current flows into the measurement terminals of your DMM. In real measurement situations, there are always input currents creating additional measurement errors. Truevolt DMMs take care of input bias current. Some alternative DMMs offer 20% to infinitely poorer performance (some are too noisy to measure).



Digital AC rms measurements: For meters in this class, only Keysight uses digital direct sampling techniques to make AC rms measurements. This results in a true rms calculation technique that avoids the slower response of analog RMS converters used in all other vendor's 6½ digit DMMs. This allows for crest factors up to 10 without additional error terms. This is a unique, patented technique – only used by Keysight.



You can measure your real-world signals with confidence

All Truevolt DMM specifications are tested and guaranteed for compliance with ISO/IEC 17025 standards so you can prove the effectiveness of your lab or production line's quality management system. Many lower-cost DMMs in this class do not carry a guarantee of their measurement specifications.

You can take advantage of expanded measurement functionality

Compared to the 34401A DMM, Truevolt DMMs offer expanded current ranges from 100 µA to 10 A. We have also added a temperature measurement function (RTD/PT100, 5 kΩ thermistor). Additionally, diode measurement capability has been expanded to allow a larger full-scale voltage to be measured (5 V) to enable the measurement of more diode types such as LEDs.

Move to The Next-Generation 34401A DMM with 100% Assurance

Migrate with confidence: Everything you depend on with the 34401A and more

Like most 34401A DMM owners, you rely on your DMM and you trust the answers it gives you. Now, with the Keysight Truevolt 34461A DMM, you can get all of the advantages of the 34401A and more. Now you can get faster answers and have even more confidence in your results. The best news of all? You can migrate from the 34401A to the 34461A without a hassle. No need to rewrite your software programs or spend hours learning a brand-new, complicated interface.

Use your existing programs: The 34461A DMM is the industry's only 100% drop-in, SCPI-compatible replacement for the 34401A DMM. Other DMMs may claim 34401A SCPI compatibility, but only a subset of SCPI commands are implemented.

No long learning curve: The Truevolt DMMs were designed by the same team that created the 34401A. The team kept 34401A measurements, reliability and familiarity in mind as they created the Truevolt family of DMMs. So you can use it without spending hours learning how. The 34461A represents everything you have known and trusted with your Keysight DMM measurements for decades – it just keeps getting stronger.

Migration Q&A	QUESTION	ANSWER
Program compatibility	Will my existing programs still work if I switch to the 34461A?	YES
Measurements	Will I have the same performance so it doesn't affect the results on my line?	YES
Cost	Will it cost the same to buy, use, maintain, and repair?	YES (and potentially less since the DMMs now include a 3-year standard warranty)
Reliability	My 34401A never breaks. Are the Truevolt DMMs going to be as good?	YES That's why we can offer a 3-year standard warranty
Use	Will we be able to use it easily? Quickly?	YES

34461A: The industry's only 100% drop-in, SCPI-compatible replacement for the 34401A DMM

1. For DC: Specifications are for 60-minute warm-up, aperture of 10 or 100 NPLC, and auto zero on. For AC: Specifications are for 60-minute warm-up, slow AC filter, sine wave.
2. 20% overrange on all ranges, except 1,000 V DCV, 750 ACV, 3 A AC, and diode test.
3. Relative to calibration standards.
4. Add this for each °C outside T_{CAL} ± 5 °C.
5. Specifications are for sine wave input > 0.3% of range and > 1 mVrms. 750 ACV range limited to 8 x 107 Volt-Hz.
6. Low-frequency performance: three filter settings are available: 3 Hz, 20 Hz, 200 Hz. Frequencies greater than these filter settings are specified with no additional errors.
7. Specifications are for 4-wire ohms function or 2-wire ohms using math null for offset. Without math null, add 0.2 Ω additional error in 2-wire ohms function.
8. Specifications are for sinewave input > 1% of range and > 10 µA AC.
9. Specifications are for the voltage measured at the input terminals. The 1 mA test current is typical. Variation in the current source will create some variation in the voltage drop across a diode junction.
10. Actual measurement range and probe errors will be limited by the selected probe. Probe accuracy adder includes all measurement and ITS-90 temperature conversion errors PT100 Ro settable to 100 Ω ± 5 Ω to remove the initial probe error.
11. Specifications are for 60-minute warm-up and sine wave input unless stated otherwise. Specifications are for 1-second gate time (7 digits).
12. Applies to sine and square inputs ≥ 100 mV. For 10 mV to < 100 mV inputs, multiply % of reading error x10.
13. Amplitude 10% – 120% of range and less than 750 ACV.
14. Square wave input specified for 10 – 300 kHz.
15. Specifications are for using Math Null zeroing. High dissapation factor capacitors may show different results than a single frequency measurement. Film capacitors usually have lower dissapation factors than other dielectrics.

1. For DC: Specifications are for 60-minute warm-up, aperture of 10 or 100 NPLC, and auto zero on. For AC: Specifications are for 60-minute warm-up, slow AC filter, sine wave.
2. 20% over range on all ranges, except 1,000 V DCV, 750 ACV, 10 A DC, 3 A AC, 10 A AC, and diode test.
3. Relative to calibration standards.
4. Add this for each °C outside T_{CAL} ± 5 °C.
5. Specifications are for sinewave input >0.3% of range and > 1 mVrms. 750 ACV range limited to 8 x 10 7 Volt–Hz.
6. Low-frequency performance: three filter settings are available: 3 Hz, 20 Hz, 200 Hz. Frequencies greater than these filter settings are specified with no additional errors.
7. Specifications are for 4-wire ohms function or 2-wire ohms using math null for offset. Without math null, add 0.2 Ω additional error in 2-wire ohms function.
8. The 10 A range is only available on a separate front-panel connector. Add 2 mA base per amp or inputs > 5 A rms.
9. Specifications are for sinewave input > 1% of range and > 10 µA AC.
10. Specifications are for the voltage measured at the input terminals. The 1 mA test current is typical. Variation in the current source will create some variation in the voltage drop across a diode junction.
11. Actual measurement range and probe errors will be limited by the selected probe. Probe accuracy adder includes all measurement and ITS-90 temperature conversion errors. PT100 Ro settable to 100 Ω ± 5 Ω to remove the initial probe error.
12. Specifications are for 60-minute warm-up and sine wave input unless stated otherwise. Specifications are for 1-second gate time (7-digits).
13. Applies to sine and square inputs ≥ 100 mV. For 10 mV to < 100 mV inputs, multiply % of reading error x10.
14. Amplitude 10% – 120% of range and less than 750 ACV.
15. Square wave input specified for 10 – 300 kHz.

1. Specifications are for 60-minute warm-up, integration setting of 10 or 100 NPLC, auto-zero on, AC slow filter. ACAL run within the last 2 days.
2. 20% over range on all ranges, except 1000 DCV, 750 ACV, 10 DCA, 3 DCA, 10 ACA, 3 ACA, and diode test have 0%.
3. Relative to calibration standards.
5. The 10 A range is only available on a separate front panel connector. Add 2 mA per amp for inputs greater than 5 Arms.
6. Add this for each °C outside TCAL ± 5 °C.
7. Add this for each °C outside the last ACAL ± 2 °C.
8. Add this for each °C outside TCAL ± 2 °C.
9. Specifications are for 4-wire ohms function or 2-wire ohms using math null for offset. Without math null, add 0.2 Ω additional error in 2-wire ohms function. The 100 M and 1 G ohm ranges are 2-wire only. See the manual for low power ohms specification and measurement currents
10. For each additional volt over ± 500 V add 0.02 mV of error.
11. Specifications are for the voltage measured at the input terminals. The 1 mA test current is typical. Variation in the current source will create some variation in the voltage drop across a diode junction.
12. See user manual for details.
13. Actual measurement range and probe errors will be limited by the selected probe. Probe accuracy adder includes all measurement and ITS-90 temperature conversion errors. PT100 Ro settable to 100 Ω ± 5 Ω to remove the initial probe error.
14. The internal reference junction uses the U1180A or equivalent adapter. This has a typical performance of ± 1.0 °C. This internal reference junction can be adjusted for better accuracy. An external reference junction can also be used.
15. Specifications are for sinewave input > 0.3% of range and > 1 mVrms. 750 ACV range limited to 8 x 10^7 Volt–Hz. For each additional volt over 300 Vrms add 1 mVrms of error.
16. Low-frequency performance: three filter settings are available: 3 Hz, 20 Hz, 200 Hz. Frequencies greater than these filter settings are specified with no additional errors.
17. Specifications are for sinewave input > 1% of range and > 10 µArms.
18. Specifications are for sine wave input unless stated otherwise.
19. Square wave input specified for 10 – 300 kHz for 1 second aperature. For shorter aperatures the minimun frequency requires > 2 cycles.
20. Input > 100 mV. For 10 mV to 100 mV inputs, multiply % of reading error x10. Amplitude 10 – 120% of range except 14 – 100% for the 750 ACV range. Specifications are for 1-second gate time (7-digits).
21. Specifications are for using Math Null zeroing. High dissapation factor capacitors may show different results than a single frequency measurement. Film capacitors usually have lower dissapation factors than other dielectrics.
22. The second burden voltage can be obtained by using the 10 A input range.

Input bias current:	< 30 pA at 25 °C
Input terminals:	Copper alloy
Input protection:	1,000 V on all ranges
True RMS AC voltage	
Measurement type:	AC–coupled True RMS. Measures the AC component of the input.
Measurement method:	Digital sampling with anti-alias filter
Maximum input:	400 DCV, 1,100 Vpeak
Input impedance:	1 MΩ ± 1%, in parallel with < 100 pF
Input protection:	750 Vrms all ranges
DC and True RMS AC current	
AC measurement type:	Directly coupled to the fuse and shunt. AC True RMS measurement (measures the AC component only).
AC measurement method:	Digital sampling with anti-alias filter
Input protection 3 A:	Externally accessible 3.15 A, 500 V fuse (Replacement part number 2110-1547 3.15 A external fuse) Internal 11 A, 1,000 V fuse (Replacement part number 2110-1402 11 A external fuse)
Input protection 10 A: (34461/65/70A only)	Internal 11 A, 1000 V fuse (Replacement part number 2110-1402 11 A external fuse)
AC crest factor and peak input	
Crest factor:	10:1 maximum crest factor, (3:1 at full-scale). Measurement bandwidth limited to 300 kHz for signal plus harmonics.
Peak input:	300% of range or maximum input
Overload ranging:	Will select higher range if peak input overload is detected during auto range. Overload is reported in manual ranging.
Resistance	
Measurement method:	Selectable 4-wire or 2-wire ohms. Current source referenced to LO input.
Maximum lead resistance (4-wire ohms):	10% of range per lead for 100 Ω, 1 kΩ ranges. 1 kΩ per lead on all other ranges.
Input protection:	1,000 V on all ranges
Continuity/diode test	
Response time:	300 samples/s with audible tone
Continuity threshold:	Fixed at 10 Ω

DC ratio	
Measurement method:	Input HI-LO/reference (sense) HI-LO
Input HI-LO:	100 mV to 1000 V ranges
Reference (sense)	HI-Input LO: 100 mV to 10 V ranges (autoranged)
Input to reference (sense):	HI and LO reference (sense) terminals reference to LO input <12 V

Temperature
PT100 platinum RTD sensor, α = 0.00385Ω/Ω/°C; DIN/IEC 751. Measurement conversions limited to –200 to 600 °C.
5 kΩ thermistor β = 3891; YSI 44007 or equivalent. Measurement conversions limited to –80 to 150 °C.

Measurement noise rejection	
60 Hz (50 Hz) for 1 kΩ LO lead unbalance (± 500 V peak maximum) DCV CMRR: 140 dB ACV CMRR: 70 dB	
Integration time	**Normal mode rejection [1]**
≥ to 1 PLC	60 dB [2]
< 1 PLC	0 db

Frequency and period	
Measurement method:	Reciprocal-counting technique. Measurement is AC-coupled using AC measurement functions.
Voltage ranges:	100 mVrms full scale to 750 Vrms. Auto or manual ranging.
Gate time:	1 ms (34465/70A), 10 ms, 100 ms, or 1 s
Measurement considerations	All frequency counters are susceptible to error when measuring low-voltage, low-frequency signals. Shielding inputs from external noise pickup is critical for minimizing measurement errors.

Autozero OFF operation
Following instrument warm–up at a stable ambient temperature ± 1 °C and < 10 minutes.
Add 0.0002% of range + 5 µV for DCV or + 5 mΩ for resistance.

Measurement settling considerations
High-power settling
Applying high-power signals (more than 300 Vrms, 500 VDC, 1A DC or 1 Arms) can cause self-heating in the signal-conditioning components. These errors are included in the instrument specifications. Internal temperature changes due to self-heating may cause additional error on other functions or ranges. The additional error will generally dissipate within a few minutes.
DC blocking capacitor
Errors will occur in ACV and Frequency functions when attempting to measure an input following a DC offset voltage change. The input blocking RC time constant must be allowed to fully settle (up to 1 second) before the most accurate measurements are possible.
External connections
Reading settling times are affected by source impedance, cable dielectric characteristics, and thermal EMF of connections. Keysight recommends the use of PTFE or other high-impedance, low-dielectric absorption wire insulation for these measurements. To maintain low thermal EMF, connectors and wires made of copper are recommended.

1. For power-line frequency ± 0.1%
2. For power-line frequency ± 1%, the NMR is 40 dB
   For ± 3%, use 30 dB

1. Reading speeds for 60 Hz (and 50 Hz) operation, autozero off, fixed range.
2. Add 5 nA for the 100 µA range, add 0.2 µA for the 10 mA range.
3. Add 20 µV for DCV and 20 mΩ for resistance. Add 0.2 µA for DC current + 10x the above range error for the 10 mA range. For 0.2 PLC multiply the above range error by 5x on the 1 A and 10 A ranges, and by 10x for the 10 mA range.
4. Maximum reading rates for 0.01% of AC step additional error. Additional settling delay required when input DC level varies.
5. For external trigger or remote operation using default settling delay (Delay Auto).
6. Maximum useful limit with default settling delays defeated.

E2308A	Thermistor temperature probe
Y1133A	Low-thermal external digital multimeter scanning kit

Definitions

Specification (spec)

The warranted performance of a calibrated instrument that has been stored for a minimum of 2 hours within the operating temperature range of 0 – 55 °C and after a 60-minute warm up period. All specifications include measurement uncertainty and were created in compliance with ISO-17025 methods. Data published in this document are specifications (spec) only where specifically indicated.

Typical (typ)

The characteristic performance, which 80% or more of manufactured instruments will meet. This data is not warranted, does not include measurement uncertainty, and is valid only at room temperature (approximately 23 °C).

Nominal (nom)

The mean or average characteristic performance, or the value of an attribute that is determined by design such as a connector type, physical dimension, or operating speed. This data is not warranted and is measured at room temperature (approximately 23 °C).

Measured (meas)

An attribute measured during development for purposes of communicating the expected performance. This data is not warranted and is measured at room temperature (approximately 23 °C).

T_{CAL}

The temperature at which the instrument was calibrated.
