8662A/8663A Synthesized Signal Generators ← GPIB

Spectral purity is the key contribution of both the Agilent 8662A and 8663A, making them ideal for many radar, satellite communication, and phase noise measurement applications. Typical absolute phase noise performance of these generators at a 1 kHz offset is as low as -135 dBc/Hz, depending on the band of operation.

The frequency range of the 8662A is 10 kHz to 1280 MHz. It offers versatile AM/FM, using either internal 400 Hz and 1 kHz rates or externally applied modulating signals which can be either ac- or dc-coupled. It also has simultaneous modulation capability.

The 8663A and 8662A provide the U.S. Air Force MATE (Modular Automatic Test Equipment) capability, via Option 700. This option is an external translator that allows the signal generator to be controlled by the MATE language CIIL (Control Interface Intermediate Language).

8663A Specifications

The 8663A signal generator is related to the 8662A in both concept and structure. Like the 8662A, the 8663A is an extremely low phase noise signal source, incorporating signal generator modulation capabilities and output characteristics. The 8663A also offers increased frequency range to 2560 MHz, increased output level to +16 dBm, and the addition of phase and pulse modulation while maintaining high spectral purity. The result is a highly flexible and powerful signal generator that uses and extends the proven circuitry of the 8662A. Thus, the 8662A and 8663A share many of the same specifications.
