All specifications apply over a $23^{\circ}\text{C} \pm 5^{\circ}\text{C}$ range (unless otherwise stated) and 30 minutes after the instrument has been turned on.

All specified and supplemental values for RF input signals are applicable to sinusoidal-wave carriers unless otherwise noted.

Specification (spec.):

Warranted performance. Specifications include guard-bands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.

Following supplemental information is intended to provide information that is helpful for using the instrument but that is not guaranteed by the product warranty.

Typical (typ.):

Describes performance that will be met by a minimum of 80% of all products. It is not guaranteed by the product warranty.

Supplemental performance data (SPD):

Represents the value of a parameter that is most likely to occur; the expected mean or average. It is not guaranteed by the product warranty.

General characteristics or nominal (nom.):

A general, descriptive term that does not imply a level of performance. It is not guaranteed by the product warranty.

About "mmW application":

Phase noise measurements above 26.5 GHz can be done by using external harmonic mixers (such as Agilent 11970 series) and a power divider (splitter) with E5053A LO and IF terminals. The E5052B's mmW application software sets up appropriate LO frequencies for the harmonic mixers.
