R&S®FSL-K20 cable TV measurements

The R&S®FSL-K20 option for the R&S®FSL spectrum analyzer makes it possible to perform measurements on analog and digital modulated TV signals in cable networks and also simplifies such measurements.

The option includes a software demodulator for analyzing digital TV signals and an internal TV trigger for analyzing analog TV signals.

General

| Frequency | | |
|------------------------------------|---|---|
| Range | vision carrier frequency with analog modulation or carrier frequency with digital modulation | 5 MHz to 1.5 GHz |
| Selection of measurement frequency | a channel table is used | selection of a channel and/or direct input of frequency |
| | no channel table is used | direct input of frequency |
| Channel tables | | |
| Characteristics | The number of channel tables that can be saved is limited only by the memory capacity of the instrument. Max. 400 channels in each channel table. Channel bandwidths from 0.1 MHz to 10 MHz. Max. 50 modulation standards, i.e. signal characteristic sets, can be present in each channel table. The modulation standard assigned to the active channel automatically configures each measurement. Channel tables can be generated and edited on the instrument at any time. <u>The most important standard channel tables and modulation standards are included.</u> | |
| Manual measurements | Operation is also possible without channel tables, in which case the user must select the measurement parameters. | |

R&S®FSL-K91n WLAN IEEE 802.11n OFDM analysis

The specifications of the R&S®FSL-K91 and R&S®FSL-K91n options are based on the data sheet of the R&S®FSL spectrum analyzer.

Specifications apply under the following conditions: 30 minutes warm-up time at ambient temperature, specified environmental conditions met, calibration cycle adhered to, and all internal automatic adjustments performed. "Typical values" are designated with the abbreviation "typ." These values are verified during the final test but are not assured by Rohde & Schwarz. "Nominal values" are design parameters that are not assured by Rohde & Schwarz. These values are verified during product development but are not specifically tested during production.
