## R&S®FSQ-B17 digital baseband interface

The R&S®FSQ-B17 option gives access to the digital baseband signals of the R&S®FSQ.

The input signals are digitized analog baseband signals, which are fed into the signal processing unit of the R&S®FSQ. The digital baseband data are applied to the I/Q DATA IN connector of the R&S®FSQ-B17 option.

The output signals are either down converted analog signals from the RF input, or digitized analog baseband input signals coming from the R&S®FSQ-B71 option. The digital baseband data (I/Q data) are accessible online at the I/Q DATA OUT connector of the R&S®FSQ-B17 option. The sampling rate is programmable within the limits defined by the resampling and decimation capabilities of the R&S®FSQ.

I/Q baseband inputs for unbalanced and balanced signals. Input impedance selectable  $50 \Omega$ / $1 M\Omega$ . All data specified with  $1 M\Omega$  input impedance setting apply to  $50 \Omega$  source impedance. Specifications are valid under the following conditions:  
 30 minutes warm-up time at ambient temperature, specified environmental conditions met, calibration cycle adhered to, and baseband calibration performed. Data without tolerances: typical values only. Data designated "nominal" apply to design parameters and are not tested.

## R&S®FSQ-B72 I/Q bandwidth extension

Activation of the 120 MHz I/Q bandwidth extension R&S®FSQ-B72 depends on the selected sampling rate.

It is active for sampling rates > 81.6 MHz. For sampling rates up to 81.6 MHz (max demodulation bandwidth 28 MHz) the standard I/Q path is used and the IQ data specifications of the basic unit apply. For sampling rates between 20.4 MHz and 81.6 MHz the 120 MHz bandwidth extension can be selected alternatively.
