## General

Product data applies under the following conditions:

- Three hours storage at ambient temperature followed by 30 minutes warm-up operation
- Specified environmental conditions met
- Recommended calibration interval adhered to
- All internal automatic adjustments performed, if applicable

## Specifications with limits

Represent warranted product performance by means of a range of values for the specified parameter. These specifications are marked with limiting symbols such as  $<$ ,  $\leq$ ,  $>$ ,  $\geq$ ,  $\pm$ , or descriptions such as maximum, limit of, minimum. Compliance is ensured by testing or is derived from the design. Test limits are narrowed by guard bands to take into account measurement uncertainties, drift and aging, if applicable.

## Specifications without limits

Represent warranted product performance for the specified parameter. These specifications are not specially marked and represent values with no or negligible deviations from the given value (e.g. dimensions or resolution of a setting parameter). Compliance is ensured by design.

## Typical data (typ.)

Characterizes product performance by means of representative information for the given parameter. When marked with  $<$ ,  $>$  or as a range, it represents the performance met by approximately 80 % of the instruments at production time. Otherwise, it represents the mean value.

## Nominal values (nom.)

Characterize product performance by means of a representative value for the given parameter (e.g. nominal impedance). In contrast to typical data, a statistical evaluation does not take place and the parameter is not tested during production.

## Measured values (meas.)

Characterize expected product performance by means of measurement results gained from individual samples.

## Uncertainties

Represent limits of measurement uncertainty for a given measurand. Uncertainty is defined with a coverage factor of 2 and has been calculated in line with the rules of the Guide to the Expression of Uncertainty in Measurement (GUM), taking into account environmental conditions, aging, wear and tear.

Device settings and GUI parameters are indicated as follows: "parameter: value".

Typical data as well as nominal and measured values are not warranted by Rohde & Schwarz.

	band 2	1.0 % (typ.)
	band 3	1.0 % (typ.)
	band 4	1.0 % (typ.)
	band 5	1.0 % (typ.)
	band 6	1.3 % (typ.)
	band 7	1.5 % (typ.)
	band 8 <sup>1</sup>	1.5 % (typ.)

<sup>6</sup> For QPSK and 8PSK, EVM can be converted into MER:  $MER = -20 \times \log EVM$ , with MER in dB and EVM in %. This means that 1 % EVM corresponds to 40 dB MER, for example.

<sup>7</sup> The maximum value deviates from the typical value because modulation quality degrades toward the band limits.

## Modes

In the DVB 32 carrier, ISDB-S 32 carrier, ISDB-S3 32 carrier and turbo 32 carrier modes, a distinction is made between data carriers and load carriers. Data carriers can transmit transport streams or PRBS as the payload and use error protection, constellation and roll-off factor in line with the selected modulation scheme. Load carriers use constellation and roll-off factor of the selected modulation scheme, but do not have error protection. As a result, they can only transmit PRBS as the content.

### Tilt

Settable tilt <sup>10</sup>	band 1	$\leq \pm 50 \text{ dB}/500 \text{ MHz}$
	band 2	$\leq \pm 50 \text{ dB}/500 \text{ MHz}$
	band 3	$\leq \pm 50 \text{ dB}/500 \text{ MHz}$
	band 4	$\leq \pm 50 \text{ dB}/500 \text{ MHz}$
	band 5	$\leq \pm 45 \text{ dB}/500 \text{ MHz}$
	band 6	$\leq \pm 45 \text{ dB}/500 \text{ MHz}$
	band 7	$\leq \pm 45 \text{ dB}/500 \text{ MHz}$
	band 8 <sup>1</sup>	$\leq \pm 45 \text{ dB}/500 \text{ MHz}$
Step size		0.1 dB

<sup>8</sup> Available with FW version higher or equal V1.09.

<sup>9</sup>  $C/N = 10 \times \log(\text{signal power}/(\text{noise power}/(500 \times 10^6) \times \text{symbol rate}))$ , with signal power and noise power in W, symbol rate in Hz; or  $C/N = \text{signal power} - \text{noise power} - 10 \times \log \text{symbol rate} + 87 \text{ dB}$ , with signal power und noise power in dBm, symbol rate in Hz.

For ARB waveform files, the symbol rate is supposed to equal  $0.65 \times \text{sample rate}$ . The accuracy of this formula depends on the bandwidth of the ARB waveform.

<sup>10</sup> The R&S®SLG generates the tilt by stepping down the level setting of the active channels. The frequency response within the channel remains flat.
